

Phase 7 — Application Development & Controlled Implementation

Expense Tracker Web Application — Navia Markets Limited

Objective

Build the approved baseline as a functioning, testable application without changing requirements.

Technology

Python, Flask, HTML5, CSS, Vanilla JavaScript and JSON persistence.

Implemented functionality

User management, active-user selection, expense create/edit/delete, validation, ownership, dashboard total/average/category breakdown, zero-expense behaviour and persistence.

Validation

User name, duplicate user, active-user dependency, amount, date, category and description validation are implemented.

Ownership

Expenses are user-scoped. Edit/delete operations require ownership and failed edits validate before mutation.

Dashboard

Total is the sum of valid active-user expenses. Average is total divided by valid expense count. Category totals are derived from valid records.

QA

TC-001–TC-065, EC-001–EC-020 and AC-001–AC-016 are preserved. No fabricated Pass/Fail results.

Acceptance

Pending Execution. Documentation readiness does not equal acceptance.

Clarifications

Exact Phase 1–6 mappings and some precise validation boundaries require verification because the source documents were not attached to the build context.

Scope

Optional Payment Method and Dashboard Filters are not mandatory. Authentication is clarification-dependent. Out-of-scope enterprise/integration features are not implemented.

Evidence

Source project and control documents are included. Runtime execution and screenshots are Pending Evidence.

Next step

Run locally, execute Phase 8 QA, capture evidence, manage defects and validate acceptance.
